#### Abstract

This is a collection of frequently asked questions (FAQ) about the **zoo** package together with their answers.

Keywords: irregular time series, daily data, weekly data, returns.

## 1. I know that duplicate times are not allowed but my data has them. What do I do?

**zoo** objects should not normally contain duplicate times. If you try to create such an object using **zoo** or read.zoo then warnings will be issued but the objects will be created. The user then has the opportunity to fix them up – typically by using aggregate.zoo or duplicated.

Merging is not well defined for duplicate series with duplicate times and rather than give an undesired or unexpected result, merge.zoo issues an error message if it encounters such illegal objects. Since merge.zoo is the workhorse behind many zoo functions, a significant portion of zoo will not accept duplicates among the times. Typically duplicates are eliminated by averaging over them, taking the last among each run of duplicates or interpolating the duplicates and deleting ones on the end that cannot be interpolated. These three approaches are shown here. Note that in the code below that force is the identity function (i.e. it just returns its argument). It is an R core function:

```
> z \leftarrow suppressWarnings(zoo(1:8, c(1, 2, 2, 2, 3, 4, 5, 5)))
1 2 2 2 3 4 5 5
1 2 3 4 5 6 7 8
> aggregate(z, force, mean)
      2
          3
              4
1.0 3.0 5.0 6.0 7.5
> aggregate(z, force, tail, 1)
1 2 3 4 5
1 4 5 6 8
> time(z) <- na.approx(ifelse(duplicated(time(z)), NA, time(z)),</pre>
      na.rm = FALSE)
> z[!is.na(time(z))]
            2 2.3333 2.6667
     1
                                                  5
     1
                                                  7
```

# 2. When I try to specify a log axis to plot.zoo a warning is issued. What is wrong?

Arguments that are part of ... are passed to the panel function and the default panel function, lines, does not accept log. Either ignore the warning, use suppressWarnings (see ?suppressWarnings) or create your own panel function which excludes the log:

```
> z \leftarrow zoo(1:100)
> plot(z, log = "y", panel = function(..., log) lines(...))
```

### 3. How do I create right and a left vertical axes in plot.zoo?

The following shows an example of creating plot containing a single panel in with both left and right axes.

```
> set.seed(1)
> z.Date <- as.Date(paste(2003, 2, c(1, 3, 7, 9, 14), sep = "-"))
> z <- zoo(cbind(left = rnorm(5), right = rnorm(5, sd = 0.2)),
+ z.Date)
> plot(z[, 1], xlab = "Time", ylab = "")
> opar <- par(usr = c(par("usr")[1:2], range(z[, 2])))
> lines(z[, 2], lty = 2)
> Axis(side = 4)
> legend("bottomright", lty = 1:2, legend = colnames(z))
> par(opar)
```

## 4. I have data frame with both numeric and factor columns. How do I convert that to a zoo object?

A "zoo" object may be (1) a numeric vector, (2) a numeric matrix or (3) a factor but may not contain both a numeric vector and factor. Use two "zoo" variables instead:

```
> DF <- data.frame(time = 1:4, x = 1:4, f = factor(1:4))
> zx <- zoo(DF$x, DF$time)
> zf <- zoo(DF$f, DF$time)</pre>
```

or convert the factor to numeric and create a single "zoo" series:

```
> z <- zoo(data.matrix(DF[-1]), DF$time)
```

## 5. Why does lag these give slightly different results on a zoo and a zooreg series which are otherwise the same?

To be definite let us consider the following examples, noting how both code and diff give a different answer with the same input except its class is "zoo" in one case and "zooreg" in another:

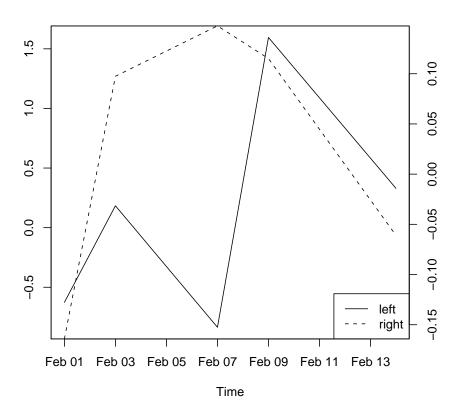

Figure 1: Left and right plot.zoo axes.

lag.zoo and lag.zooreg work differently. For "zoo" objects the lagged version is obtained by moving values to the adjacent time point that exists in the series but for "zooreg" objects the time is lagged by deltat, the time between adjacent regular times.

A key implication is that "zooreg" can lag a point to a time point that did not previously exist in the series and, in particular, can lag a series outside of the original time range whereas that is not possible in a "zoo" series.

Note that lag.zoo has an na.pad= argument which in some cases may be what is being sought here.

The difference between diff.zoo and diff.zooreg stems from the fact that diff(x) is defined in terms of lag like this: x-lag(x,-1).

### 6. How do I subtract the mean of each month from a zoo series?

Suppose we have a daily series. To subtract the mean of Jan 2007 from each day in that month, subtract the mean of Feb 2007 from each day in that month, etc. try this:

```
> set.seed(123)
> z <- zoo(rnorm(100), as.Date("2007-01-01") + seq(0, by = 10,
+ length = 100))
> z.demean1 <- z - ave(z, as.yearmon(time(z)))</pre>
```

To subtract the mean of all Januaries from each January, etc. try this:

```
> z.demean2 <- z - ave(z, format(time(z), "%m"))
```

### 7. How do I create a monthly series but still keep track of the dates?

Create a S3 subclass of "yearmon" called "yearmon2" that stores the dates as names on the time vector. It will be sufficient to create an as.yearmon2 generic together with an as.yearmon2.Date methods as well as the inverse: as.Date.yearmon2. This new class will act the same as "yearmon" stores and allows recovery of the dates using as.Date and aggregate.zoo as shown in the test at the end of this example:

```
> as.yearmon2 <- function(x, ...) UseMethod("as.yearmon2") 
> as.yearmon2.Date <- function(x, ...) { 
+ y \leftarrow as.yearmon(with(as.POSIXlt(x, tz = "GMT"), 1900 + year + mon/12)) 
+ names(y) \leftarrow x
```

```
structure(y, class = c("yearmon2", class(y)))
+ }
> as.Date.yearmon2 <- function(x, frac = 0, ...) {</pre>
      if (!is.null(names(x)))
          return(as.Date(names(x)))
      x \leftarrow unclass(x)
      year \leftarrow floor(x + 0.001)
      month <- floor(12 * (x - year) + 1 + 0.5 + 0.001)
      dd.start <- as.Date(paste(year, month, 1, sep = "-"))</pre>
      dd.end <- dd.start + 32 - as.numeric(format(dd.start + 32,</pre>
          "%d"))
      as.Date((1 - frac) * as.numeric(dd.start) + frac * as.numeric(dd.end),
          origin = "1970-01-01")
+ }
> dd <- seq(as.Date("2000-01-01"), length = 5, by = 32)
> z <- zoo(1:5, as.yearmon2(dd))
> z
Jan 2000 Feb 2000 Mar 2000 Apr 2000 May 2000
                2
                          3
                                   4
> aggregate(z, as.Date, force)
2000-01-01 2000-02-02 2000-03-05 2000-04-06 2000-05-08
                     2
                                3
         1
```

### 8. How are axes added to a plot created using plot.zoo?

On single panel plots axis or Axis can be used just as with any classic graphics plot in R.

```
> z <- zoo(0:500, as.Date(0:500))
> plot(z, xaxt = "n")
> tt <- time(z)
> m <- unique(as.Date(as.yearmon(tt)))
> jan <- format(m, "%m") == "01"
> mlab <- substr(months(m[!jan]), 1, 1)
> Axis(side = 1, at = m[!jan], labels = mlab, tcl = -0.3, cex.axis = 0.7)
> Axis(side = 1, at = m[jan], labels = format(m[jan], "%y"), tcl = -0.7)
> Axis(side = 1, at = unique(as.Date(as.yearqtr(tt))), labels = FALSE)
```

A multivariate series can either be plotted as multiple single panel plots:

```
+ Axis(side = 1, at = unique(as.Date(as.yearqtr(tt))), labels = FALSE)
+ }
> par(opar)

or as a multipanel plot. In this case any custom axis must be placed in a panel function.
> plot(z3. screen = 1:3. xaxt = "n". nc = 2. vlim = range(z3).
```

```
> plot(z3, screen = 1:3, xaxt = "n", nc = 2, ylim = range(z3),
      panel = function(...) {
          lines(...)
          panel.number <- parent.frame()$panel.number</pre>
          nser <- parent.frame()$nser</pre>
          if (panel.number % 2 == 0 || panel.number == nser) {
               tt <- list(...)[[1]]
              m <- unique(as.Date(as.yearmon(tt)))</pre>
               jan <- format(m, "%m") == "01"</pre>
              mlab <- substr(months(m[!jan]), 1, 1)</pre>
               Axis(side = 1, at = m[!jan], labels = mlab, tcl = -0.3,
                   cex.axis = 0.7)
               Axis(side = 1, at = m[jan], labels = format(m[jan],
                   "y"), tcl = -0.7)
               Axis(side = 1, at = unique(as.Date(as.yeargtr(tt))),
                   labels = FALSE)
          }
      })
```

### 9. Why is nothing plotted except axes when I plot an object with many NAs?

Isolated points surrounded by NA values do not form lines so try one of the following:

```
> z <- zoo(c(1, NA, 2, NA, 3))
> plot(z)
> plot(z, type = "p")
> plot(na.omit(z))
> plot(na.approx(z))
> plot(z, type = "p")
> lines(na.omit(z))
```

Note that this is not specific to **zoo.** If we plot in R without zoo we get the same behavior.

### 10. What other packages use zoo?

The packages on CRAN that depend on zoo are: FinTS, PerformanceAnalytics, RBloomberg, dyn, dynlm, fUtilities, fda, fxregime, lmtest, party, sandwich, strucchange, tripEstimation, tseries and xts. Also these packages suggest the use of zoo with them: TSSQLite, TSdbi, Zelig, gsubfn and pscl.
